TITLE: On the quality of measuring instruments

SOURCE: Pomiar automatyka kontrola, no. 1, 1964, 5-9

TOPIC TAGS: instrument quality factors, instrument material requirements, instrument control standards, instrument legal aspects

ABSTRACT: The quality of a measuring instrument is a factor of its metrological properties, usually established by legal standards and specifications; its operating properties, which determine its degree of reliability under specific working conditions; its make and finish, which determine its quality of performance and appearance. In Poland, the legal organ responsible for the quality of measuring instruments as well as for the types of manufactured and imported measuring instruments is the Administracja Miar (Administration of Measures).

The production of measuring instruments absorbs a relatively small quantity of materials, however, the variety of required materials is considerable and their

Card 1/2

ACCESSION NR: AP4016399

quality standards high. The standardization problems and legal aspects of check and reference instruments is controlled by GUM. Emphasis is placed on precision, reliability and quality parameters of measuring instruments and reference devices in particular, which are to be guaranteed by the manufacturer. The legal aspects of such responsibilities are discussed at length. The conclusion contains remarks by N. S. Khrushchev made in April 1964 with regard to the importance of quality control in production for the entire national economy.

TOPIC TAGS: radiation, airfield, radioactive contamination

ABSTRACT: The paper deals in some detail with radioactive and chemical contamination on an airfield, in general, and radiation effect on humans and other objects, in particular. Operations on a contaminated airfield performed with various degrees of radiation and involving aircraft, safety measures, determination and control of the contaminated area decontamination of the airstrips, access roads, and areas for various types of work, preparation of aircraft, protection of the crew, and takeoff and landing on a contaminated airfield are discussed. Tables and diagrams in the original article show relationship between the degree of radioactive contamination and various types of work, maximum working time as a function of air

TITLE: Airports as objects of nuclear attack

SOURCE: Vazduhoplovni glasnik, no. 5, 1964, 553-566

TOPIC TAGS: nuclear warfare, airfield, airfield protection, nuclear explosion, fallout

ABSTRACT: Since present day airforces are still tied to airfields, so that their fighting potential depends on the security of their bases, airfields will continue to represent objects inviting nuclear attacks for many years to come. Without quoting any sources of information, the author discusses the operative-tactical importance of airfields, the protection of airfields against nuclear warfare, and types and respective strengths of nuclear explosions (surface, low altitude, or high altitude explosions), and how they affect the planes and personnel, the underground effects of nuclear explosions, the shock and radioactivity produced by such explosions, and the radioactive fallout following explosions. The article concludes with a study of the effects of bombing accuracy and discusses the necessary means for the construction of a network of airfields needed for the support of 1000 tactical aircraft. It is clear that any such analysis leads in the end to a clash between what is

Card 1/2

L 24330-65

ACCESSION NR: AP5001734

desirable and what is economically feasible. Due to the limits imposed on resources, the author believes that the classical means of warfare still retain their value, especially when combined with appropriate nuclear strikes. Orig. art. has: 7 figures and 3 tables.

**AUTHORS:** Kavečanský, Vincent, Hajko, Vladimír and Daniel-Szabó, Juraj (Košice)

**TITLE:** Influence of successive changes of magnetization on the domain structure of polycrystalline Fe-Si sheets

**PERIODICAL:** Matematicko-fyzikálny časopis, no. 1, 1963, 64 - 71

**TEXT:** The successive magnetization of a ferromagnetic sample in the fields  $H_a$  and  $H_b$ , where  $H_b \neq H_a$ , is accompanied by two effects: "reptation" and "Bascule-negative". The present paper is a continuation of earlier work (present authors and H. Gengnagel - Czechosl. Journ. Phys. 12, 1962) in which the microprocesses occurring in ferromagnets due to asymmetric successive magnetizations were studied. Polycrystalline Fe-Si sheets (5.2% Si, 0.0027% C) were heated in argon for three hours at 1100 °C and then cooled over a period of 5 hours to 300 °C. The further cooling proceeded freely in air. Two toroidal samples (a) Ø28 mm (Ø22.5 mm), 0.225 mm; b) Ø28.5 mm (Ø22.5 mm), 0.25 mm) were etched from this sheet and mechanically and electrolytically polished. The coercive force of the samples was 0.3 Gs. The domain structure

Card 1/3

Influence of ....

Z/045/63/000/001/001/003  
E024/E309

was observed, with the aid of the Bitter-Akulov method, mostly on crystallites with the (110) surface parallel to the polished face of the sample. The magnetization was achieved by switching the field from  $H = 0$  to  $H = H_a \approx 1.5 \text{ Oe}$ . The samples were previously demagnetized. The position of the Bloch walls was a function of the number  $n$  of successive magnetizations. Some walls moved more than others and the dependence of their motion upon  $n$  also differed for different walls. Fig. 6 shows a plot for a crystallite of sample b, of the movement of eleven different walls from their original position as a function of  $\log n$  (a -  $H = 0$ , b)  $H = H_a$ ). The macroscopic effects of "reptation" and "Bascule-negative" are the results of the investigated microprocesses. It is apparent that some walls move practically only with small  $n$ , while others start their motion at higher  $n$ . The effect "Bascule-negative" is only observed at  $n < 20$ . There are 6 figures.

Title : Application of Titanate Oscillators to Medical Ultrasonic Generators

Orig Pub : Proc. II conf. ultrason., 1956, Warszawa, PWN, 1957, 135-137

Abstract : The author records the development and production of two types of medical ultrasonic generators, intended for therapy and microbiological research. Both types of generators are designed for operation with converters made of barium titanate, out of economic and structural considerations and also out of considerations of operating convenience (the use of low supply voltages, the possibility of using flexible cables). The ultrasonic therapeutic generator operates at a frequency of 800 kc in continuous or pulsed operation, and the repetition frequency and the pulse durations can be adjusted over a wide range. The generator is provided with ultrasonic

Med. Weterym., 1954, 10, No 11, 663-664; Polish

Abstract: A method is proposed for checking milk pasteurization by determination  
of phosphatase with the sodium salt of phenolphthaleinophosphoric acid  
which is based on the property of phosphatase to decompose the ester  
linkage of phosphoric acid with formation of a pink coloration. A  
procedure is described for preparing the reagent and also the carry-  
ing out of a qualitative test. Properly pasteurized milk produces a  
pinkish-red coloration, raw milk remains white.
